

## Axle<sup>®</sup> Interspinous Fusion System

## Modular Interspinous Fusion Device

## Axle<sup>®</sup> Fusion System

The Axle interspinous fusion system offers multiple configurations allowing the surgeon to precisely tailor the implant to the patient's anatomy. Implanted via a tissue sparring approach, Axle presents a viable option for surgeons looking for a minimally invasive alternative to pedicle screws for rigid posterior fixation.

> Clinically proven alternative to bilateral pedicle screw fixation in a retrospective TLIF case series while potentially offering reduced operating room time and hospital stay.\*

> Modular systems enable a precise fit to patient anatomy with either PEEK or titanium inserts to aid in spinous process distraction. Inserts can be loaded with bone graft to enhance fusion potential.

> Comprehensive system including flared plate option to capture L5-S1 as well as complementary allograft insert to enhance spinous process distraction.

## Also available:

H-shaped cortical allograft block available in 2mm increments from 8mm to 20mm.
